JavaScript/TypeScript (CCC)

Introduction

Common Chain Connector (CCC) is a JavaScript/Typescript SDK tailored for CKB. Highly recommended as the primary CKB development tool, CCC offers advantages over alternatives such as Lumos and ckb-js-sdk.

CCC also serves as a wallet connector enhancing interoperability between wallets across different blockchains. Explore by checking out the CCC Demo.

Install Packages

CCC is designed for both front-end and back-end developers. It streamlines the development process by offering a single package that caters to a variety of requirements:

NodeJS | Custom UI | Web Component | React

```
npm install @ckb-ccc/core
```

- NodeJS
- Custom UI
- Web Component
- React

To use CCC, import the desired package:

```
import { ccc } from "@ckb-ccc/<package-name>";
```

CCC encapsulates all functionalities within the `ccc` object, providing a unified interface.

For advanced developers, CCC introduces `cccA` object that offers a comprehensive set of advanced features:

```
import { cccA } from "@ckb-ccc/<package-name>/advanced";
```

> **NOTE**
>
> Please notice that these advanced interfaces are subject to change and may not be as stable as the core API.

Transaction Composing

Below is a example demonstrating how to compose a transaction for transferring CKB:

```
const tx = ccc.Transaction.from({
  outputs: [{ lock: toLock, capacity: ccc.fixedPointFrom(amount) }],
});

// Instruct CCC to complete the transaction
await tx.completeInputsByCapacity(signer);
await tx.completeFeeBy(signer, 1000); // Specify the transaction fee rate
const txHash = await signer.sendTransaction(tx); // Send and get the transaction hash
```
